Welcome to Recharge Chargine

A short note before you dive in.

Congratulations, and welcome to the team. You're joining a small, early-stage deep-tech company at a genuinely pivotal moment — the decisions made over the next twelve months will determine whether our core invention, the RADAX™ generator, goes from validated simulation to physical prototype to a licensed product inside real wind turbines.

This guide exists so that **every new team member — whatever function you're joining, engineering, business, operations, content, research, or something else entirely — starts from the same complete picture**. It covers who we are, what we've built, how we make money, where we actually stand today (including the open problems, not just the wins), and how we work together day to day.

Read it fully before your first week ends. You don't need to memorise every number, but you should be able to explain — accurately, to a stranger — what Recharge does, why it matters, and what stage we're at.

HOW THIS GUIDE IS ORGANISED

Sections 02–04 cover the **company** — our identity, legal standing, and the people behind it. Sections 05–08 cover the **product and business** at a business-appropriate level of depth (detailed engineering IP is confidential and excluded — see Section 06). Sections 09–13 cover our **traction and trajectory**. Sections 14–16 cover **how we work**, a glossary, and where to go for more.

ONE GROUND RULE, STATED EARLY

We maintain a strict distinction between what is *simulation-validated*, what is an *estimate*, and what is an *unvalidated target*. This document follows that same standard throughout — every figure is labelled honestly. Represent us the same way, always.

Who We Are

Our identity, our founding story, and the platform we're building.

Recharga Chargine Private Limited is a deep-tech clean energy startup incorporated in Jaipur, Rajasthan, in April 2023. We are recognised by the Government of India (DPIIT, Startup India) and are focused on one mission: re-architecting how multi-megawatt electrical generators are built, starting with wind.

We are **not a hardware manufacturer, and we are not a turbine company**. We are a technology and IP licensing company. We invent a better generator architecture, protect that invention through patents, validate it through rigorous simulation and (soon) physical testing, and then license it to the original equipment manufacturers (OEMs) who build the physical turbines and machines.

The wind energy sector is one of the fastest-growing parts of the global energy transition — but the generator at the heart of every turbine is still heavy, expensive, mechanically complex, and over-engineered for its own good. We believe a smarter electromagnetic architecture can change that fundamentally. That is the problem we exist to solve.

OUR IDENTITY IN ONE LINE

We are a **B2B deep-tech IP licensing company** in the clean energy space — think of a company like Arm Holdings, but for wind generators. We own the architecture; our partners own the factory.

2023

Year founded

3MW

Flagship product output

People on the team

What "RADAX" Means

Our flagship — and currently only — product is **RADAX™**, a portmanteau of **RAD**ial + **AX**ial. RADAX is a platform, not a single fixed design: the same underlying architecture is engineered to scale, adapt, and eventually extend beyond wind turbines into other places where large, low-speed electrical machines are needed. The engineering detail behind the name is confidential IP — see Section 06.

Our Long-Term Vision — A Universal Torque Platform

We describe our long-term ambition as building a **universal torque platform** for the green energy transition. The beachhead market is onshore wind. But the underlying architecture is modular and transferable by design — to hydroelectric turbines, to hybrid-vehicle alternators, and beyond. We are not just improving a component. We are proposing a new foundation for how multi-megawatt rotating machines get built.

Onshore Wind — Beachhead

3–6 MW turbine class.
~\$100B application-level TAM. Active OEM technical discussions already underway.

Hydroelectric — Next

Run-of-river and low-head hydro turbines. ~\$20B+ TAM. A natural second market for the same core architecture.

Hybrid Vehicles — Future

Heavy-duty trucks and range-extender alternators. ~\$300B+ TAM. Long-term expansion target.

Company at a Glance

Legal name	Recharga Chargine Private Limited
Founded	April 2023, as a Private Limited Company
Sector (self-certified)	Renewable Energy · Manufacture of Electrical Equipment

Intellectual Property

Our patent is one of the two pillars our entire competitive position rests on.

We are a DPIIT-recognised Indian startup, and our legal standing is in good order — that's not something you need to carry the details of day to day. What every team member should understand well is our intellectual property position, since it's core to how we operate and what we protect.

PATENT APPLICATION

Our core generator architecture is the subject of an Indian patent application — **Application No. 202411070882**. A First Examination Report (FER) response is currently underway. A formal Freedom-to-Operate (FTO) study, confirming the design does not overlap with existing global patents, is planned as a pre-licensing milestone. Design details are confidential — see below.

IP is one of our two defensible moats (the other is our engineering know-how). Detailed technical architecture and simulation data are confidential and are not included in this guide — access is restricted to the engineering team on a need-to-know basis. See Section 14 for our confidentiality norms.

Meet the Founders

Two complementary founders, a growing technical bench, and everyone carrying disproportionate responsibility.

We are an early-stage team of 10+ people. Understanding who leads what — and the mindset behind their decisions — will help you collaborate effectively from day one.

SS**Sehej Sharma**

Founder & CEO

Leads company strategy, fundraising, OEM and investor relations, and commercial planning. Drives market entry and deployment strategy, and owns the "why" and the "who" of everything the company does externally. If you're unsure whether something is your call to make externally, it almost certainly runs through Sehej.

STRATEGY

FUNDING

PARTNERSHIPS

OPERATIONS

AE**Ali Electricwala**

Founder & CPO

Leads all engineering design and simulation work, and developed the original core architecture. Oversees technical validation of the product and drives the engineering roadmap and prototype planning. The engineering ground truth of the product lives with Ali. Detailed technical and design specifics are confidential and restricted to the engineering team on a need-to-know basis.

ENGINEERING

PROTOTYPE PLANNING

CT**Technical Co-Founder / CTO**

Role open — actively recruiting

A leadership position being filled to co-lead engineering direction alongside Ali, own the technical roadmap, and help close knowledge-transfer gaps as the team scales. Like our Chief Engineer search, this is a chance to join at founding-team depth, not as employee number fifty.

HIRING

ENGINEERING LEADERSHIP

CE**Chief Engineer**

Role open — actively recruiting

A graduate or master's-level position being filled on an equity-plus-co-inventor-IP-credit basis. A reminder that at this stage, exceptional contributors can end up with their name on the patent, not just a line on a resume.

HIRING

EQUITY + IP CREDIT

WE'RE HIRING — TECHNICAL LEADERSHIP

Both the **Technical Co-Founder / CTO** and **Chief Engineer** roles are open right now. If you know exceptional electromagnetic design or generator engineering talent — or that's you — this is a founding-level opportunity, not a standard hire. Route interest to Sehej.

Recharga was built on a simple conviction: the biggest unsolved problem in wind energy isn't the blades, the software, or the site selection — it's the generator itself, which has barely changed in architecture despite decades of turbine scale-up. Sehej and Ali set out to question that default rather than optimise around it. That same instinct — *question the default, validate honestly, then commit* — is the standard every team member is expected to bring to their own work here, regardless of function.

Key External Relationships to Know

Relationship Type	Status
Manufacturing partner — Co-Founder level contact	Signed Letter of Interest; our most advanced commercial relationship
Leading Indian wind OEM	Active pipeline target — technical discussion stage
Indian wind OEM / IPP	Active pipeline target — technical discussion stage
Global wind OEM	Active pipeline target — technical discussion stage

05

The Problem We're Solving

The \$110 billion global wind industry is trapped by a single flawed compromise at the heart of every turbine.

Every wind turbine needs a generator to convert the rotating force of the blades into electricity. Today, turbine designers are forced into an unpleasant choice between two imperfect options:

Option A — Geared Systems

A gearbox steps up the slow rotation of the blades to speeds a smaller, cheaper generator can use. Gearboxes are a well-known, statistically guaranteed point of mechanical failure — draining project profits through ongoing maintenance, especially offshore where a single repair visit is enormously expensive.

Option B — Oversized Direct-Drive

Remove the gearbox entirely and connect the generator straight to the rotor — but because it must now turn at very low speed (12–15 rpm), the generator has to become enormous and heavy (55–65 tonnes) to produce enough torque. That inflates project cost and turns transport and installation into a logistical nightmare.

WHY THIS MATTERS

This single, flawed compromise inflates the cost of every wind project, adds risk to profitability, and throttles the pace of the global transition to clean energy. As turbine power ratings keep climbing — 3 MW, 5 MW, 6 MW and beyond — both problems scale *disproportionately* worse: more weight, more cost, harder transport, harder maintenance.

The Symptoms, Concretely

- **High maintenance cost** — gearbox failure is one of the leading causes of unplanned turbine downtime industry-wide.
- **Enormous, heavy generators** — a large number of heavy components drives up both capital cost and structural loading on the turbine tower and nacelle.
- **Low power density** — conventional direct-drive machines produce relatively little power per kilogram of generator mass.
- **Logistics and installation risk** — a single-piece 55–65 tonne generator is difficult and expensive to transport, crane, and service on-site.

This is exactly the compromise RADAX™ is designed to eliminate. Section 06 explains how.

Our Product — The RADAX™ Generator

A patent-pending, 3 MW generator platform for wind turbines. This is what everything we do orbits around.

RADAX™ is a gearless, direct-drive generator built to remove the compromise described in Section 05. It's designed to be lighter and more compact than a conventional direct-drive generator of the same output, without reintroducing a gearbox as a point of failure.

3MW

Rated output

~30% better

Power-to-weight vs. conventional direct-drive designs

What Makes It Different, at a Glance

Gearless by Design

Direct-drive coupling to the turbine shaft removes the gearbox — the single most common point of mechanical failure in conventional turbines.

Modular Construction

Built from independently manufactured sections rather than one oversized single machine — easier to transport, install, and service on-site.

Lighter, More Compact

A meaningfully better power-to-weight ratio than conventional direct-drive designs, reducing structural load on the turbine tower and nacelle.

The detailed electromagnetic architecture, engineering specifications, and simulation data behind RADAX are **confidential intellectual property** and are intentionally not included in this guide. They're protected under our patent application (Section 03) and shared internally on a need-to-know basis. If your role requires that depth, your manager will arrange access separately — please don't request or share it outside that process.

Where the Technology Stands

We are in the validated-simulation stage, working toward a physical prototype. We describe this using **Technology Readiness Level (TRL)**, a standard 1–9 scale used across deep-tech and government-funded R&D:

TRL 4–5

Where we are today — component-level validation complete

TRL 7

Our next major milestone — prototype demonstrated

Section 10 covers our engineering milestones and current status at the level appropriate for this guide — real progress and real open items, without the underlying technical detail.

07 The Business Model

A dual-channel B2B model, built for capital efficiency and near-zero marginal cost at scale.

We do not build factories, and we do not sell electricity. We license technology and, in the near term, sell hardware units to build commercial proof — a strategic combination designed for deep industry integration without heavy capital expenditure on our own manufacturing.

Primary Revenue — Technology Licensing

We license the RADAX™ architecture to wind turbine OEMs under an annual, recurring fee:

Secondary Revenue — Direct Unit Sales

Per-Unit Price

INR 40,000

~\$500 USD per RADAX generator unit

Annual licensing fee range
INR 15 Cr – INR 50 Cr / year
(~\$2M – \$6.5M USD)

Escalation
Compounding 12% p.a.

Determined by:

- Client production volume
- Scale of integration
- Projected energy savings delivered

This is a near-zero marginal cost model. Once the IP is licensed, revenue scales with minimal proportional cost growth — yielding very high gross and EBITDA margins (see Section 12).

Estimated COGS

INR 15,000–20,000

~\$180–240 USD · healthy gross margin

WHY THIS CHANNEL EXISTS

Licensing is the prize. Direct unit sales are the proof-of-traction bridge that gets us there — an asset-light channel fulfilled through vetted contract manufacturers, not our own factory.

Ancillary & Future Revenue Streams

Maintenance & Support

Recurring revenue from premium service contracts covering maintenance, support, and performance optimisation.

Integration Services

Paid, specialised engineering consulting for clients requiring complex, custom integrations.

Data & Analytics (SaaS)

A future platform providing performance monitoring and predictive-maintenance analytics from a network of connected RADAX units.

How the Licensing Fee Is Actually Calculated

The annual fee isn't a flat number — it's produced by a weighted model that scores each prospective client and places their Year-1 fee inside the ₹15–50 Cr band:

Company Size

33% weight · normalised against 1–50 wind farms

Energy Consumption

33% weight · normalised against 100–5,000 GWh/year

Savings Achieved

34% weight · normalised against 2%–15% savings

A client with **10 wind farms**, **1,200 GWh/year** total energy consumption, and **8% savings achieved** produces a weighted index of ~0.29, placing their **Year-1 licensing fee at ≈ ₹25.2 Cr**. At 12% annual compounding, that same client's fee grows to **≈ ₹69.9 Cr by Year 10**.

Why an OEM Says Yes — Client ROI

Consider a client licensing the technology at ₹25 Cr/year and applying it across a fleet of ~700 turbines: payback occurs within **4–5 months**, and a full rollout delivers **>1000% ROI annually** through reduced operations & maintenance costs and efficiency gains. That economic case — not just the technology itself — is what we lead with in every OEM conversation.

Projected Revenue Mix (3–5 Year View)

70–80%

Technology licensing

20–30%

Direct hardware sales

White-labelling / technology transfer is opportunistic and not included in the core forecast.

08

Market Opportunity & Competition

A large near-term beachhead in Indian wind, inside a much larger platform-wide opportunity.

We size our opportunity through two honest lenses: the immediate wind-specific beachhead we're pursuing first, and the long-term, platform-wide opportunity across every application RADAX's architecture can eventually serve.

Lens 1 — Wind Beachhead (Near-Term)

Lens 2 — Full Platform (Long-Term)

Both framings come directly from our own investor and grant materials. They're scoped differently on purpose — one narrow and wind-specific, one wide and platform-wide — so use whichever matches the conversation, and never blend the numbers together.

Staged Market Expansion

Competitive Landscape

Category	How We Compare
Direct — dynamic / wireless EV charging technology providers	Different market. They solve charging infrastructure; RADAX is a generation-efficiency platform with far broader applications (wind, hydro, industrial).
Indirect — major global wind turbine OEMs	We license to them, not compete against them — a low-risk way for them to upgrade their products without in-house R&D risk.
Indirect — regional generator suppliers	RADAX offers higher performance density in a gearless design, plus a modular, ship-in-sections transport advantage for logistically difficult regions.
Adjacent — specialised motor startups (EV / aerospace)	Optimised for high-speed EV/aerospace use cases, not multi-MW low-speed wind — a fundamentally different design problem.
Adjacent — rare-earth-free generator design startups	We use rare-earth magnets short-term for maximum performance density; our modular design offsets material cost through reduced structural steel. Long-term ESG roadmap explores reduced rare-earth designs.

Our Sustainable Competitive Advantage

Patent Protection

Our novel generator architecture is protected under patent Application No. 202411070882. Design details are confidential.

Technical Know-How

Deep in-house expertise in advanced electromagnetic simulation and modular design — a real barrier to entry that's hard to replicate quickly.

Performance & Modularity

Meaningfully better performance density than typical designs in its class, plus a ship-in-sections modular design that solves transport and on-site assembly challenges.

09

Traction & Commercial Pipeline

Early but real commercial interest, converted step by step into paid pilots and licences.

Partner Type	Stage	Typical Sales Cycle
Manufacturing partner / early adopter	LOI Signed	Active negotiation
Leading wind OEM (India)	Technical discussions	18–24 months
Wind OEM / IPP (India)	Technical discussions	18–24 months
Wind OEM (Global)	Technical discussions	18–24 months

"We are highly impressed with the potential your product has to transform energy efficiency across sectors... Your product's capacity to capture and regenerate energy offers an excellent fit for our applications of manufacturing." — **Co-Founder, our signed manufacturing partner**

Near-Term Sales Pipeline Motion

1

FINALISE & RE-ENGAGE

Complete third-party validation

Present certified performance data to our active OEM leads to advance from technical evaluation toward commercial negotiation.

2

SECURE FIRST REVENUE

Convert leads into paid pilots

Advance our most engaged lead toward a paid Proof-of-Concept agreement, and convert our manufacturing partner's Letter of Interest into an initial direct-sales order for a set of RADAX units.

3

CONVERT POC TO LICENCE

Sign our first major licensing agreement

On successful Proof-of-Concept completion, begin negotiations to convert that partner into our first full, multi-year licensing client — and use that success to open a second paid PoC with another pipeline OEM.

Regional Expansion & Manufacturing Partners

India

Active technical discussions with leading Indian wind OEMs. Contract manufacturers identified in-country, with supplier MoUs already in place for critical components.

MENA

Strategic funding and pilot pathways being explored via regional clean-energy accelerator programmes.

Southeast Asia

Longer-horizon expansion target for Years 3–5, once the India beachhead is established.

10

Milestones — Where We Stand Today

Progress is real. So are the open challenges. You should be able to speak to both.

COMPLETED • APRIL 2023

Company Incorporation & DPIIT Recognition

Incorporated 7 April 2023. Recognised as a deep-tech startup under DPIIT's Startup India scheme.

COMPLETED

Patent Application Filed

Indian Patent Application No. 202411070882 filed; First Examination Report (FER) response underway. Covers our core generator architecture — full design details are confidential.

COMPLETED

Component-Level Engineering Validation

Individual system components validated through internal engineering simulation, confirming strong performance at the component level.

COMPLETED • MARCH 2026

Combined-System Simulation

Our most current, honest result. A full combined-system simulation surfaced an open engineering item, which the technical team is now resolving (see next milestone). Technical specifics are confidential.

COMPLETED

Letter of Interest — Manufacturing Partner

Signed with our manufacturing partner. Our most advanced commercial relationship to date.

IN PROGRESS

Resolving an Open Engineering Item

Led by Ali and the incoming technical co-founder. Final performance validation and specification confirmation are pending resolution before the design is locked for prototyping.

IN PROGRESS

Seed / Pre-Series A Fundraise

Targeting ₹12–15 Crore. Investor materials, data room, and financial projections are all live, active documents.

UPCOMING

Prototype Build (Target: TRL 7)

Planned post-funding, involving contract manufacturers in India. Independent certification to follow prototype validation.

UPCOMING

Freedom-to-Operate (FTO) Patent Study

To be commissioned. A critical, pending step before any commercial licensing agreement is finalised.

11

Roadmap to Commercialization

Our six-phase methodology for taking RADAX from simulation to a market-ready, licensed product.

This is the phased structure we planned our engineering and go-to-market work around. Live, current status against this plan is tracked in Section 10 — treat the phase *descriptions* below as the durable methodology, not the original target dates, since real engineering timelines shift as open

items surface and get solved properly. Detailed engineering methodology is confidential and summarised here at a high level only.

1

Simulation & Design Optimisation

A comprehensive internal simulation programme to characterise and refine the design before committing to a physical build.

2

Design Reiteration

Refine the design based on simulation feedback, targeting improved efficiency and smoother mechanical performance, validated through follow-up simulation cycles.

3

Prototype Development

Source high-grade components, assemble the first physical prototype, and conduct initial quality checks.

4

Physical Testing & Validation

Measure real-world performance under operating conditions and compare directly against simulation predictions.

5

Licensing & Market-Entry Prep

Develop licensing agreements tailored to OEM partners, pursue required certifications (IEC 61400-5, ISO 9001), and prepare marketing and case-study materials from validated prototype performance.

6

Production & Commercialisation

Establish manufacturing partnerships, run pilot production to refine quality control, and begin sales through licensing and direct unit channels.

Go-to-Market — Three Phases

1

NEXT 6–9 MONTHS

Secure Beachhead & Validate

Pilot the 3 MW RADAX prototype with an OEM partner as a paid Proof-of-Concept.

2

MONTHS 9–24

Land & Expand

Convert the Proof-of-Concept into a full, multi-year licensing deal and recurring revenue.

Scale & Diversify

Replicate the licensing model with global OEMs and expand into hydro and industrial applications.

12

Financial Snapshot & Funding

A high-margin, licensing-driven model with a clearly scoped seed raise ahead of it.

5-Year Revenue Projection (Annual Recurring Revenue)

Metric	2026	2027	2028	2029	2030
New licensing deals	1	2	4	6	8
Total active licences	1	3	7	13	21
Annual recurring revenue	\$2.2M	\$6.7M	\$15.7M	\$31.4M	\$47M
Gross profit	\$2M	\$6M	\$14M	\$28.2M	\$41.7M
EBITDA margin	60%	60%	64%	75%	75%

Forward-looking projection — based on a focused, high-margin technology-licensing model reaching over \$40M in annual recurring revenue by Year 5, driven by adoption from major global OEMs.

Unit Economics — From Prototype to Scale

Detailed component-level cost breakdowns are commercially sensitive and not included here. At a summary level, per-unit cost falls sharply as production scales — the pattern any hardware-adjacent licensing business depends on:

Highest

One-off prototype stage
(includes one-time engineering & tooling costs)

Lower

Pilot scale — 10 to 50 units

Lowest

Commercial scale — 1,000+ units

Current Funding Ask

SEED / PRE-SERIES A

We are seeking **₹12–15 Crore** to fund final engineering validation, prototype development, manufacturing-feasibility work, and continued OEM engagement. Investor readiness is a live, ongoing priority across the company.

13 Our Long-Term Vision

We are not improving a generator. We are proposing a new foundation for how multi-megawatt rotating machines get built.

Wind is the beachhead — the market where the pain is most acute and the commercial path is clearest. But the underlying architecture beneath RADAX was never designed to be wind-only. It's a general answer to a general problem: *how do you generate a lot of torque, efficiently, without building one enormous, expensive, hard-to-transport machine?* That question shows up everywhere multi-megawatt rotating power is needed.

Onshore & Offshore Wind

The proving ground. 3–6 MW turbine class today, with the same architecture scaling toward larger offshore-class turbines as validation matures.

Hydroelectric Power

Run-of-river and low-head hydro turbines share the same low-speed, high-torque profile RADAX is built for — a natural, technically close second market.

Hybrid Vehicle Alternators

Heavy-duty hybrid trucks and range-extender systems need exceptional power-to-weight — exactly RADAX's design strength. A longer-horizon, much larger TAM.

WHY WE BELIEVE WE WIN

Our technology is the only approach in our competitive set that delivers **both** high power density — cutting CAPEX — **and** gearless reliability — cutting OPEX — at once. That combination is what produces the lowest total cost of ownership for a partner, and it's the thesis every future application of the platform is built on.

"Innovation distinguishes between a leader and a follower." We look forward to partnering with the industry to revolutionise energy efficiency in the industries of tomorrow. In short: we are not just improving generators — we are re-architecting how multi-megawatt generators are built.

Life at Recharge — Culture & How We Work

We're a small team carrying disproportionate responsibility. Here's what that means for how you'll work, whatever function you're in.

Whether you've joined engineering, business development, operations, content, research, or something else, the same operating norms apply. This isn't a shadow programme — you're not observing, you're doing, from week one.

Communication

Default to written updates over verbal check-ins so context isn't lost. Flag blockers early rather than sitting on them. Everyone's time is scarce — come to conversations with the context already gathered, not needing to be re-explained.

Confidentiality

Our patent-pending architecture, simulation data, and commercial terms are the company's core assets. Treat every technical and commercial detail as confidential by default. Nothing goes external — to a friend, a social post, a forum — without clearing it first.

Quality Standards

Speed matters at a startup, but not at the cost of accuracy. A wrong number repeated externally costs more than a slower, correct one. Check your work, especially anything with figures, specs, or claims attached to it.

Brand Voice

We are precise, technically credible, and confident without overselling. We label what's validated, what's estimated, and what's a target — always. That honesty is a feature of our brand, not a weakness to hide.

Six Ground Rules

1 • Be Accurate or Be Quiet

Never represent an unvalidated figure as confirmed. If you're not sure whether something is proven, say so — or ask before repeating it externally.

2 • IP Is Sacred

Architecture details, simulation results, and unfiled technical claims do not leave the company without explicit clearance.

3 • Speed With Quality

Move fast, but don't let speed become an excuse for sloppy, unchecked output — especially anything a partner or investor will see.

4 • Surface Problems Early

An open engineering item found during validation (Section 10) was worth more to us discovered honestly than hidden. Bring us bad news as fast as good news.

5 • Think Before You Ask

Check this guide, search existing materials, and take a first pass at an answer before escalating a question upward.

6 • Own Your Output

Whatever you produce — a document, a deck, a line of code, a piece of content — put your name behind its accuracy and quality.

Your First Week

- ☒ Read this entire guide, end to end, before day 3
- ☒ Meet the founders and understand who owns what (Section 04)
- ☒ Get access to the shared drive, communication tools, and key documents (Section 16)
- ☒ Build a personal glossary of anything unclear, and confirm it with your manager
- ☒ Understand what you're expected to own or contribute to in your first month
- ☒ Ask: "What does good look like for my role here in 30 days?" — and write the answer down

Glossary of Key Terms

The vocabulary you'll hear daily, decoded.

Term	What It Means at Recharge
RADAX™	Our flagship product — a patent-pending 3 MW generator platform for wind turbines. The name is a portmanteau of RADial + AXial. Detailed architecture is confidential.
TRL	Technology Readiness Level (1–9). We are currently at TRL 4–5 — component-level validation complete, working toward a physical prototype. TRL 7 (prototype demonstrated in a relevant environment) is our next major milestone.
Direct-Drive	The generator is coupled directly to the turbine shaft — no gearbox. Eliminates mechanical losses and improves reliability. A widely used industry term, not unique to us.
OEM	Original Equipment Manufacturer — the wind turbine builders we license our IP to.
IP Licensing	Our primary revenue model — an annual fee charged to OEMs for the right to use the RADAX architecture. Near-zero marginal cost once IP is licensed.
LOI	Letter of Interest — a non-binding expression of commercial interest. We have one signed with a manufacturing partner.
FTO Study	Freedom-to-Operate patent study — confirms RADAX can be commercialised without infringing existing patents. A pending, critical task.
DPIIT	Department for Promotion of Industry and Internal Trade — the Indian government body that recognises us as a startup.
PLI Scheme	Production Linked Incentive — a government incentive our technology qualifies for. Relevant to OEM partnership conversations in India.
TDB / IREDA	Technology Development Board / Indian Renewable Energy Development Agency — grant bodies relevant to de-risking our early pilots.
TAM / SAM / SOM	Total / Serviceable / Serviceable Obtainable Market — the standard funnel for sizing a market opportunity, used two ways in Section 08.
COGS / BOM	Cost of Goods Sold / Bill of Materials — general terms for what it costs to build one unit. Our specific figures are commercially sensitive.

Term	What It Means at Recharge
Pre-Series A	The funding round we are currently targeting — ₹12–15 Crore, sitting between seed and Series A in the startup funding lifecycle.

16

Resources, Documents & Contact

Where to go for more depth once you've finished this guide.

Key Source Documents

Detailed engineering and technical documents exist but are restricted to the engineering team — they're intentionally excluded from this general onboarding set.

Document	What It Covers
Recharge Chargine — Pitch Deck	The primary investor narrative — problem, solution, business model, market, financials, team
Business Model & Monetization Strategy	Full commercial model detail, beyond what's summarised in Section 07
Market Size Analysis & Competitor Landscape	Full TAM/SAM/SOM methodology and competitor-by-competitor breakdown
Pricing Structure & Sales Pipeline	Full pricing logic and the detailed sales pipeline plan
Product Roadmap	The complete phase-by-phase commercialisation plan
RADAX Licensing Fee Calculator (.xlsx)	The live spreadsheet model behind the licensing fee example in Section 07

A CLOSING NOTE

You're joining at a moment where the decisions made in the next twelve months will determine whether RADAX goes from simulation to prototype to a licensed product inside real wind turbines. That's a rare vantage point for anyone this early in their career. Learn fast, contribute honestly, and remember that everything you do here either moves the company forward or it doesn't — make it the former.
